

Computer System Structure

Professor Fernando Buarque, PhD

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Topics

- ◆ Computer System Operation
- ◆ I/O Structure
- ◆ Storage Structure
- ◆ Storage Hierarchy
- ◆ Hardware Protection
- ◆ General System Architecture

Computer-System Architecture

Computer-System Operation

- ◆ I/O devices and the CPU can execute concurrently.
- ◆ Each device controller is in charge of a particular device type.
- ◆ Each device controller has a local buffer.
- ◆ CPU moves data from/to main memory to/from local buffers
- ◆ I/O is from the device to local buffer of controller.
- ◆ Device controller informs CPU that it has finished its operation by causing an *interrupt*.

Common Functions of Interrupts

- ◆ Interrupt transfers control to the interrupt service routine generally, through the *interrupt vector*, which contains the addresses of all the service routines.
- ◆ Interrupt architecture must save the address of the interrupted instruction.
- ◆ Incoming interrupts are *disabled* while another interrupt is being processed to prevent a *lost interrupt*.
- ◆ A *trap* is a software-generated interrupt caused either by an error or a user request.
- ◆ An operating system is *interrupt driven*.

Interrupt Handling

- ◆ The operating system preserves the state of the CPU by storing registers and the program counter.
- ◆ Determines which type of interrupt has occurred:
 - *polling*
 - *vectored* interrupt system
- ◆ Separate segments of code determine what action should be taken for each type of interrupt

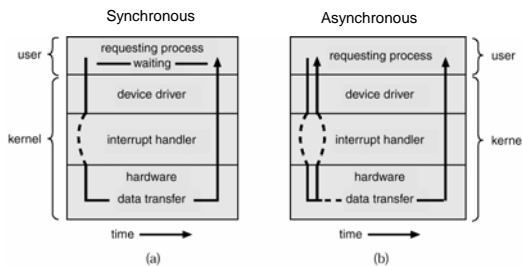

Interrupt Time Line For a Single Process Doing Output

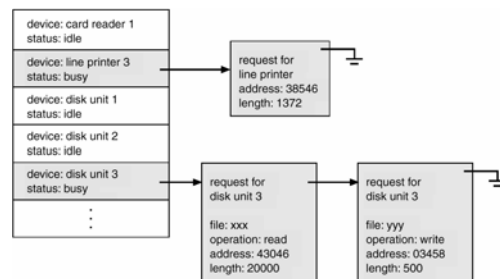

I/O Structure

- After I/O starts, control returns to user program only upon I/O completion.
 - Wait instruction idles the CPU until the next interrupt
 - Wait loop (contention for memory access).
 - At most one I/O request is outstanding at a time, no simultaneous I/O processing.
- After I/O starts, control returns to user program without waiting for I/O completion.
 - System call* – request to the operating system to allow user to wait for I/O completion.
 - Device-status table* contains entry for each I/O device indicating its type, address, and state.
 - Operating system indexes into I/O device table to determine device status and to modify table entry to include interrupt.

Two I/O Methods

Device-Status Table

I/O treatment (review)

- Implemented in various ways
- Asynchronous is more efficient
- Wait time can be used for processing other requests in time sharing systems

Direct Memory Access Structure

- Used for high-speed I/O devices able to transmit information at close to memory speeds.
- Device controller transfers blocks of data from buffer storage directly to main memory without CPU intervention.
- Only one interrupt is generated per block, rather than the one interrupt per byte.

Storage Structure

- ♦ Main memory – only large storage media that the CPU can access directly (words).
- ♦ Secondary storage – extension of main memory that provides large nonvolatile storage capacity.
- ♦ Magnetic disks – rigid metal or glass platters covered with magnetic recording material
 - Disk surface is logically divided into *tracks*, which are subdivided into *sectors*.
 - The *disk controller* determines the logical interaction between the device and the computer.

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Main memory

- ♦ Normal access
- ♦ Memory Mapped I/O
 - Fast operations (e.g. video, serial ports, etc)
 - Device ready
 - ♦ Programmed I/O (PIO) - Polling
 - ♦ Interruption based – no polling

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Moving-Head Disk Mechanism

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Disk access delay

- ♦ Seek time
 - cylinder
- ♦ Latency
 - sector

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Storage Hierarchy

- ♦ Storage systems organized in hierarchy.
 - Speed
 - Cost
 - Volatility
- ♦ *Caching* – copying information into faster storage system; main memory can be viewed as a last *cache* for secondary storage.

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Storage-Device Hierarchy

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Caching

- ◆ Use of high-speed memory to hold recently-accessed data / instruction
- ◆ Requires a *cache management* policy.
- ◆ Caching introduces another level in storage hierarchy. This requires data that is simultaneously stored in more than one level to be *consistent*.

Engenharia da Computação

Hardware Protection (avoiding operational errors)

- ◆ Dual-Mode Operation
- ◆ I/O Protection
- ◆ Memory Protection
- ◆ CPU Protection

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Dual-Mode Operation

- ◆ Sharing system resources requires operating system to ensure that an incorrect program cannot cause other programs to execute incorrectly.
- ◆ Provide hardware support to differentiate between at least two modes of operations.
 1. *User mode* – execution done on behalf of a user.
 2. *Monitor mode* (also *kernel mode* or *system mode*) – execution done on behalf of operating system.

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Dual-Mode Operation (Cont.)

- ◆ *Mode bit* added to computer hardware to indicate the current mode: monitor (0) or user (1).
- ◆ When an interrupt or fault occurs hardware switches to monitor mode.
- ◆ *Privileged instructions* can be issued only in monitor mode.

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Dual-Mode Operation

- ◆ Interaction

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

I/O Protection

- ◆ All I/O instructions are privileged instructions.
- ◆ Must ensure that a user program could never gain control of the computer in monitor mode (I.e., a user program that, as part of its execution, stores a new address in the interrupt vector).

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Use of A System Call to Perform I/O

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Memory Protection

- ◆ Must provide memory protection at least for the interrupt vector and the interrupt service routines.
- ◆ In order to have memory protection, add two registers that determine the range of legal addresses a program may access:
 - **Base register** – holds the smallest legal physical memory address.
 - **Limit register** – contains the size of the range
- ◆ Memory outside the defined range is protected.

Hardware Address Protection

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

Hardware Protection

- ◆ When executing in monitor mode, the operating system has unrestricted access to both monitor and user's memory.
- ◆ The load instructions for the *base* and *limit* registers are privileged instructions.

Engenharia da Computação
(Sistemas Operacionais – Turma NQ)

Profs. Fernando Buarque
1o. Semestre de 2009

CPU Protection

- ♦ *Timer* – interrupts computer after specified period to ensure operating system maintains control.
 - Timer is decremented every clock tick.
 - When timer reaches the value 0, an interrupt occurs.
- ♦ Timer commonly used to implement time sharing.
- ♦ Time also used to compute the current time.
- ♦ Load-timer is a privileged instruction.

Engenharia da Computação
